

**ABSTRACT**  
**SYSTEM INFORMATION OF POLYCLINIC**

Polyclinic is one of the community service unit that operates in the field of health. A clinic that offers health care facilities that specialize to outpatient care. The main goal of the clinic is to serve the patient to be treated, and is the main activity, for the provision of information to support and improve the system is in need. Computer-based information system will be very different from the information system is done manually. Data processing is still manual, how it works will be very slow and takes time to be able solve it. Construct of information system was created with the JAVA programming language and MySQL as database. Data management in the clinic is one important component in establishing an information system in the clinic. Management of data manually, has many drawbacks, besides take a long time, its accuracy is also less acceptable, expected with data management information system is to be replaced by a computerized manual.

Key Word : MySQL, Java, System Information, Polyclinic
