

ABSTRACT

ORDERING FOOD APPLICATION BASED CLIENT SERVER WITH ANDROID PLATFORM

At this time, there are many food ordering using manual recording system, where there are some problems such as the systems are not sequential order food mutilations.

We have also been known to a client server based system where data exchange can use *android* smartphones. This thesis did research and creation of applications on the benefits of a client server system and smartphone media in the process of ordering food.

The method is used to parse the data between the smartphone with the server using JSON. By using this method, it can produce an application by now where customers can order a meal using *android* smartphone and get the order queue booking orders according to schedule.

Keywords: *Android, Client Server, JSON.*
